**Multigraph:**  $G = (V, E)$ , where  $V$  is a non-empty set (of vertices), and  $E$  is the **multiset** (of edges) on  $V$ , i. e., there exists a map  $m : \binom{V}{2} \rightarrow \mathbb{N}$ .

Graph Algorithms \* C. Croitoru - Graph Algorithms \* C. Croitoru - Graph Algorithms \* C. Croitoru -

$e \in \binom{V}{2}$ , with  $m(e) > 0$  is an edge of the multigraph  $G$ ; if  $m(e) = 1$ , then  $e$  is a **simple edge**, otherwise is a **multiple edge** of **multiplicity**  $m(e)$ .

- Graph Algorithms \* C. Croitoru - Graph Algorithms \* C. Croitoru - Graph Algorithms \* C.

The **support graph** of a multigraph,  $G$ , is the graph obtained from  $G$  by replacing each multiple edge by a simple one.

## Variations in the definition of a graph

**Pseudograph (general graph):**  $G = (V, E)$ , where  $V$  is a non-empty set (of vertices), and  $E$  is the **multiset** (of edges) on  $V \cup \binom{V}{2}$ , i. e., there exists a map  $m : V \cup \binom{V}{2} \rightarrow \mathbb{N}$ .

$e \in E \cap V$  (i. e.,  $|e| = 1$ ) is called a **loop**.

The **support graph** of a pseudograph  $G$  is the graph obtained from  $G$  by replacing each multiple edge by a simple one and by removing the loops.

# Variations in the definition of a graph

**Digraph (directed graph):**  $D = (V(D), E(D))$ , where  $V(D)$  is a non-empty set (of vertices), and  $E(D) \subseteq V(D) \times V(D)$  is the set of **arcs** (or **directed edges**).

If  $e \in E$  then  $e = (u, v)$  (or simply  $e = uv$ ) is an arc directed from  $u$  to  $v$ , and we say:

- $u$  is the **initial extremity (tail)** of  $e$ ,  $v$  is the **final extremity (head)** of  $e$ ;
- $u$  and  $v$  are **adjacent**;
- $e$  is **incident from**  $u$  and **into**  $v$ ;
- $v$  is a **successor** of  $u$ , and  $u$  is a **predecessor** of  $v$  etc.

# Variations in the definition of a graph

**Infinite (di)graphs:** the set of vertices and/or the set of edges (arcs) is countable infinite.

An infinite graph is **locally finite** if  $N(v)$  is a finite set, for any vertex  $v$ .

\* C. Croitoru - Graph Algorithms \* C. Croitoru - Graph Algorithms \* C. Croitoru - Graph

## Hypergraphs (Finite Set Systems)

- Edges, now called **hyperedges**, are not restricted to be 2-subsets of the vertex set. A hyperedge is a non-empty subset of the vertex set.
- **$k$ -uniform hypergraph**: every edge has cardinality  $k$ .

Graph Algorithms \* C. Croitoru - Graph Algorithms \* C. Croitoru - Graph Algorithms \* C. Croitoru

Every hypergraph can be represented as a bipartite graph:

Hypergraph  $H$

Bipartite graph associated with  $H$

- Graph Algorithms - C. Croitoru - Graph Algorithms - C. Croitoru - Graph Algorithms

Let  $G = (V, E)$  be a graph and  $v \in V$ .

- **Degree** of vertex  $v$ :  $d_G(v)$  = number of edges incident to  $v$ .
- $v$  is an **isolated vertex** if  $d_G(v) = 0$  and **pendant** (or **leaf**) if  $d_G(v) = 1$ .

$$\sum_{v \in V} d_G(v) = 2|E|.$$

- **Maximum degree**  $\Delta(G)$  and **minimum degree**  $\delta(G)$ :

$$\Delta(G) = \max_{v \in V} d_G(v), \quad \delta(G) = \min_{v \in V} d_G(v).$$

- If  $\Delta(G) = \delta(G) = k$ , then  $G$  is  **$k$ -regular**.
- **Null graph**: a 0-regular graph.

## Degrees

Let  $G = (V, E)$  be a digraph and  $v \in V$ .

- Indegree of vertex  $v$ :  $d_G^-(v)$  = number of arcs incident into  $v$ .
- Outdegree of vertex  $v$ :  $d_G^+(v)$  = number of arcs incident from  $v$ .

$$\sum_{v \in V} d_G^+(v) = \sum_{v \in V} d_G^-(v) = |E|.$$

## Subgraphs

Let  $G = (V(G), E(G))$  be a graph.

- If  $A \subseteq V(G)$ , then the subgraph  $[V(G) \setminus A]_G$ , denoted by  $G - A$ , is the subgraph obtained from  $G$  by deleting the vertices from  $A$ .  $G - \{u\}$  is called a **deleted subgraph** and is denoted by  $G - u$ .
- If  $B \subseteq E(G)$ , then the subgraph  $\langle E(G) \setminus B \rangle_G$ , denoted by  $G - B$ , is the subgraph obtained from  $G$  by deleting the edges from  $B$ .  $G - \{e\}$  is denoted by  $G - e$ .

# Graph classes - Cliques

C. Croitoru - Graph Algorithms \* C. Croitoru - Graph Algorithms \* C. Croitoru - Graph Algorithms

A  $k$ -subset of vertices of a graph  $G$  that induces a complete graph is called a  $k$ -clique.

clique number of  $G$  :  $\omega(G) = \max_{Q \text{ clique in } G} |Q|.$

Remark.  $\omega(G) = \alpha(\overline{G}).$

Croitoru - Graph Algorithms \* C. Croitoru - Graph Algorithms \* C. Croitoru - Graph Algorithms \*

## Example

$\omega(G) = 3$

$\omega(G) = 2$

$\omega(G) = 4$

# Graph classes - Bipartite graphs

C. Croitoru - Graph Algorithms \* C. Croitoru - Graph Algorithms \* C. Croitoru - Graph Algorithms

**Bipartite graph:** a graph  $G$  with the property that  $V(G)$  can be partitioned in two stable sets.

If  $V(G) = S \cup T$ ,  $S \cap T = \emptyset$ ,  $S, T \neq \emptyset$ ,  $S, T$  stable sets in  $G$ , then  $G$  is denoted  $G = (S, T; E(G))$ .

**Complete bipartite graph:**  $G = (S, T; E(G))$ , with  $uv \in E(G)$ ,  $\forall u \in S$  and  $\forall v \in T$ ; denoted by  $K_{s,t}$ , where  $s = |S|$ ,  $t = |T|$ .

Croitoru - Graph Algorithms \* C. Croitoru - Graph Algorithms \* C. Croitoru - Graph Algorithms \*

Graph Algorithms \* C. Croitoru - Graph Algorithms \* C. Croitoru - Graph Algorithms \* C. Croitoru  
- Graph Algorithms \* C. Croitoru - Graph Algorithms \* C. Croitoru - Graph Algorithms \*

Let  $G = (V, E)$  be a graph.

- **Connected graph**: there is a path between any pair of vertices. Otherwise the graph is **disconnected**.
- **Connected component** of a graph  $G$ : a maximal connected subgraph,  $H$ , of  $G$  (i. e., there is no connected subgraph  $H'$  of  $G$ ,  $H' \neq H$ ,  $H$  being a subgraph of  $H'$ ).
- Every graph can be expressed as a disjoint union of its connected components.
- The following binary relation is an equivalence relation:  $\rho \subseteq V \times V$ , given by  $u\rho v$  (i. e.,  $(u, v) \in \rho$ ) if there is a path in  $G$  between  $u$  and  $v$ .
- The connected components of  $G$  are the subgraphs induced by the equivalence classes of  $\rho$ .

## Paths and Cycles - Connectivity

## Example

four connected components

Let  $D = (V, E)$  be a digraph.

- **Weakly connected (or simply, connected) digraph:** its support graph  $M(D)$  is connected.
- **Unilaterally connected digraph:** there is a path from  $u$  to  $v$  or from  $v$  to  $u$ , for any two vertices  $u, v \in V$ .
- **Strongly connected digraph:** there is a path from  $u$  to  $v$ , for any two vertices  $u, v \in V$ .

**Exercise 11.** Let  $G$  be a graph having the property that  $d_G(u) + d_G(v) \geq |G| - 1$ ,  $\forall u, v \in V(G)$ ,  $u \neq v$ . Prove that the diameter of  $d(G) \leq 2$ .

## Exercises for the 3rd seminar

**Exercise 12.** Let  $G = (V, E)$  be a graph with  $V = \{v_1, v_2, \dots, v_n\}$  such that  $d_G(v_1) \leq d_G(v_2) \leq \dots \leq d_G(v_n)$ . Prove that  $G$  is connected if  $d_G(v_p) \geq p$ , for every  $p \leq n - d_G(v_n) - 1$ .

**Exercise 13.** Let  $G = (V, E)$  be a graph and  $S$  be a stable set of  $G$ . Prove that  $S$  is of maximum cardinality if and only if for every stable set of  $G$ ,  $S' \subset V \setminus S$ , we have

$$|S'| \leq |N_G(S') \cap S|.$$

**Exercise 14.** Let  $G = (V, E)$  be a digraph. A strongly connected component of  $G$  is a maximal (related to inclusion) sub-digraph  $H$ , of  $G$  which is strongly connected (i. e.,  $H$  is strongly connected and there is no strongly connected sub-digraph  $H'$  of  $G$ ,  $H \subsetneq H'$ ).

Define the following binary relation on  $V$ ,  $\rho \subseteq V \times V$ , given by:  $u\rho v$  (i. e.,  $(u, v) \in \rho$ ), if there is a directed path in  $G$  from  $u$  to  $v$  and a directed path from  $v$  to  $u$ .

- (a) Prove that  $\rho$  is an equivalence relation.
- (b) Show that the strongly connected components of  $G$  are the sub-digraphs induced by the equivalence classes of  $\rho$ .
